

Alzikrayat Photo Sharing Application

Project Name

Alzikrayat Photo Sharing Application

Simple Description

Alzikrayat is a PHP and MySQL photo-sharing application. Registered users can create accounts, log in, upload photos, browse a responsive gallery, view photo details, delete their own photos, and add comments.

Technologies

- PHP 8+
- MySQL and PDO
- HTML5, CSS3, and JavaScript
- Bootstrap 5
- Apache and XAMPP
- Git and GitHub

Main Features

- User registration, login, logout, and sessions.
- Secure password hashing and last-login cookie.
- Photo upload, gallery, details, and ownership-protected deletion.
- Comments for authenticated users.
- Three gallery layouts: three columns, four columns, and list view.
- CSRF protection, server-side validation, prepared statements, and XSS protection.
- Responsive design for desktop, tablet, and mobile screens.

How to Run on Windows

1. Install and start XAMPP

Install XAMPP for Windows, open the XAMPP Control Panel, and start:

- Apache
- MySQL

Both services should show a running status.

2. Copy the project

Copy the project folder to:

Plain Text

```
C:\xampp\htdocs\Alzikrayat
```

The main file must exist at:

Plain Text

```
C:\xampp\htdocs\Alzikrayat\public\index.php
```

3. Create the database

Open phpMyAdmin:

Plain Text

```
http://localhost/phpmyadmin
```

Create a database named `alzikrayat`. Open it, select **Import**, choose the project's `database.sql` file, and click **Go**. The tables `users`, `photos`, and `comments` should appear.

4. Configure the database connection

Open:

Plain Text

```
C:\xampp\htdocs\Alzikrayat\config\database.php
```

For the default XAMPP installation, use:

PHP

```
$host = '127.0.0.1';  
$name = 'alzikrayat';
```

```
$user = 'root';  
$pass = '';
```

If MySQL has a password, replace the empty value with the correct password.

5. Create the upload folder

Make sure this folder exists:

Plain Text

C:\xampp\htdocs\Alzikrayat\public\images\uploads

If it does not exist, create the folders manually from File Explorer. The folder must allow Apache to write uploaded images.

6. Open the application

Open a browser and visit:

Plain Text

<http://localhost/Alzikrayat/public/>

You can also open:

Plain Text

<http://localhost/Alzikrayat/public/index.php>

7. Optional PHP development server

Instead of Apache, open PowerShell in the project folder and run:

Plain Text

```
cd C:\xampp\htdocs\Alzikrayat  
C:\xampp\php\php.exe -S 127.0.0.1:8000 -t public public\index.php
```

Then open:

Plain Text

<http://127.0.0.1:8000>

Keep the PowerShell window open while using the application. Use either the Apache URL or the PHP-server URL, not both at the same time.

Project Structure

Plain Text

config/	Database configuration
core/	MVC core and Manual Router
controllers/	Application logic
models/	Database models
views/	User-interface pages
public/	Entry point, CSS, and uploads
database.sql	MySQL schema

Student Information

Student Name: Mohamed Jamal Ahmed

Course: Advanced Web Technologies

Project: Alzikrayat Photo Sharing Application
